Celestial Reference Frames

Christopher S. Jacobs

Jet Propulsion Laboratory, California Institute of Technology

2018 March 21

Outline

I. Concepts and Background:

- A. What is a Reference frame? Concepts, uses, desired properties
- B. Networks: The instruments used to build the frame
 - ad hoc, VLBA, EVN, Global, NASA-ESA DSN, LBA, AuScope, etc.
- C. Brief history of Astrometry: The 'fixed' stars aren't so fixed.
 - 1. Precession, proper motion, nutation, parallax
 - 2. Invention of radio astronomy. VLBI's pursuit of (sub)milli-arcsecond accuracy.

II. Celestial Frames built using *Very Long Baseline Interferometry* (VLBI)

- A. Surveys: Single dish, connected array: JVAS, AT20G, and VLBI: VCS, LCS
- B. ICRF-1, ICRF-2: The IAU moves to from optical (stars) to radio (quasars)
- C. Higher frequency radio frames: K&Q (24 & 43GHz), X/Ka (32 GHz)

III. The Path to the Future:

- A. Error Budgets: a tool for allocating resources for improvement
- B. Case study: Path to Improved X/Ka (8.4/32 GHz) Frame
- C. ICRF-3: the next standard radio frame
- D. Gaia: an optical frame with high accuracy, billion sources

I. A. Concepts for Celestial Frames

1. **Questions:**

Why do we need reference frames? Celestial Frames?
Time, positions, velocities

2. **The Celestial Frames**

Terrestrial: Azimuth, Elevation
Equatorial plane: Right Ascension & Declination
Ecliptic Plane: Ecliptic Longitude & Latitude
Galactic Plane: Galactic Longitude & Latitude

3. **Inertial Frames**

approximate point sources at infinity

No rotation

No acceleration

Quasi-inertial

I. A.1 Why a Celestial Frame?

Questions:

Why do we need reference frames? Celestial Frames?

To measure Time, positions, and velocities

Time: The rotation of the earth

Positions & velocities:

Angular positions and distances of

Quasars, galaxies, stars, planets, spacecraft

I. A.2 The Celestial Sphere

Preferred Frame changes with scale and application

- **Local terrestrial:** Elevation, Azimuth
Local gravity or normal to horizon gives preferred direction
Useful for antenna pointing
- **Equatorial plane:** Right Ascension & Declination
Earth's spin gives preferred direction
- **Ecliptic Plane:** Ecliptic longitude & latitude
plane of solar system, planetary orbits
useful for studying the solar system and
inter-planetary navigation
- **Galactic Plane:** Galactic Longitude & latitude
plane of Milky Way galaxy
Useful for pulsars, masers, rotation curves...
- **Even larger structure:** local group of galaxies, Virgo cluster, ...

I. A.2 Local Horizon: Azimuth, Elevation

- Local terrestrial: **Elevation, Azimuth**
Local gravity or normal to horizon gives preferred direction
Useful for antenna pointing

I. A.2 The Celestial Sphere

Equatorial System:

Earth's spin axis gives preferred direction, the celestial pole

Coordinates on the sky:

Right Ascension (“longitude”)
Declination (“latitude”)

Ecliptic Plane:

Ecliptic Longitude & Ecliptic Latitude
plane of solar system
useful for studying the solar system and inter-planetary navigation

Credit: <http://www.daviddarling.info/encyclopedia/C/celsphere.html>

I. A.2 The Celestial Sphere

- Galactic Plane: Galactic Longitude, l , & Galactic latitude, b
Useful for pulsars, masers, rotation curves...

Galactic center: VLA radio image
Kassim, NRAO. <http://images.nrao.edu/326>

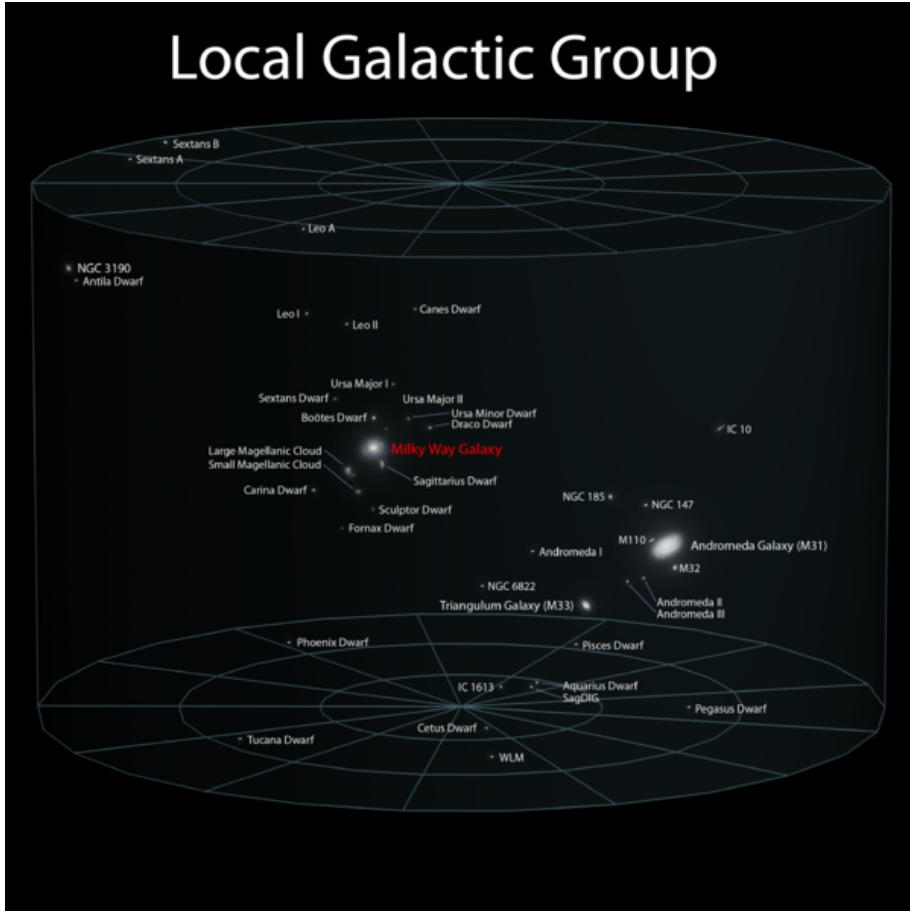

Credit: Robert Hurt & NASA
<http://tracingknowledge.wordpress.com/tag/milky-way/>

I. A.2 The Celestial Sphere

- How far before we get to the quasars? Even larger structures: local group of galaxies, Virgo cluster, Virgo super cluster...

Local Galactic Group

~3 Million light years

Virgo Supercluster

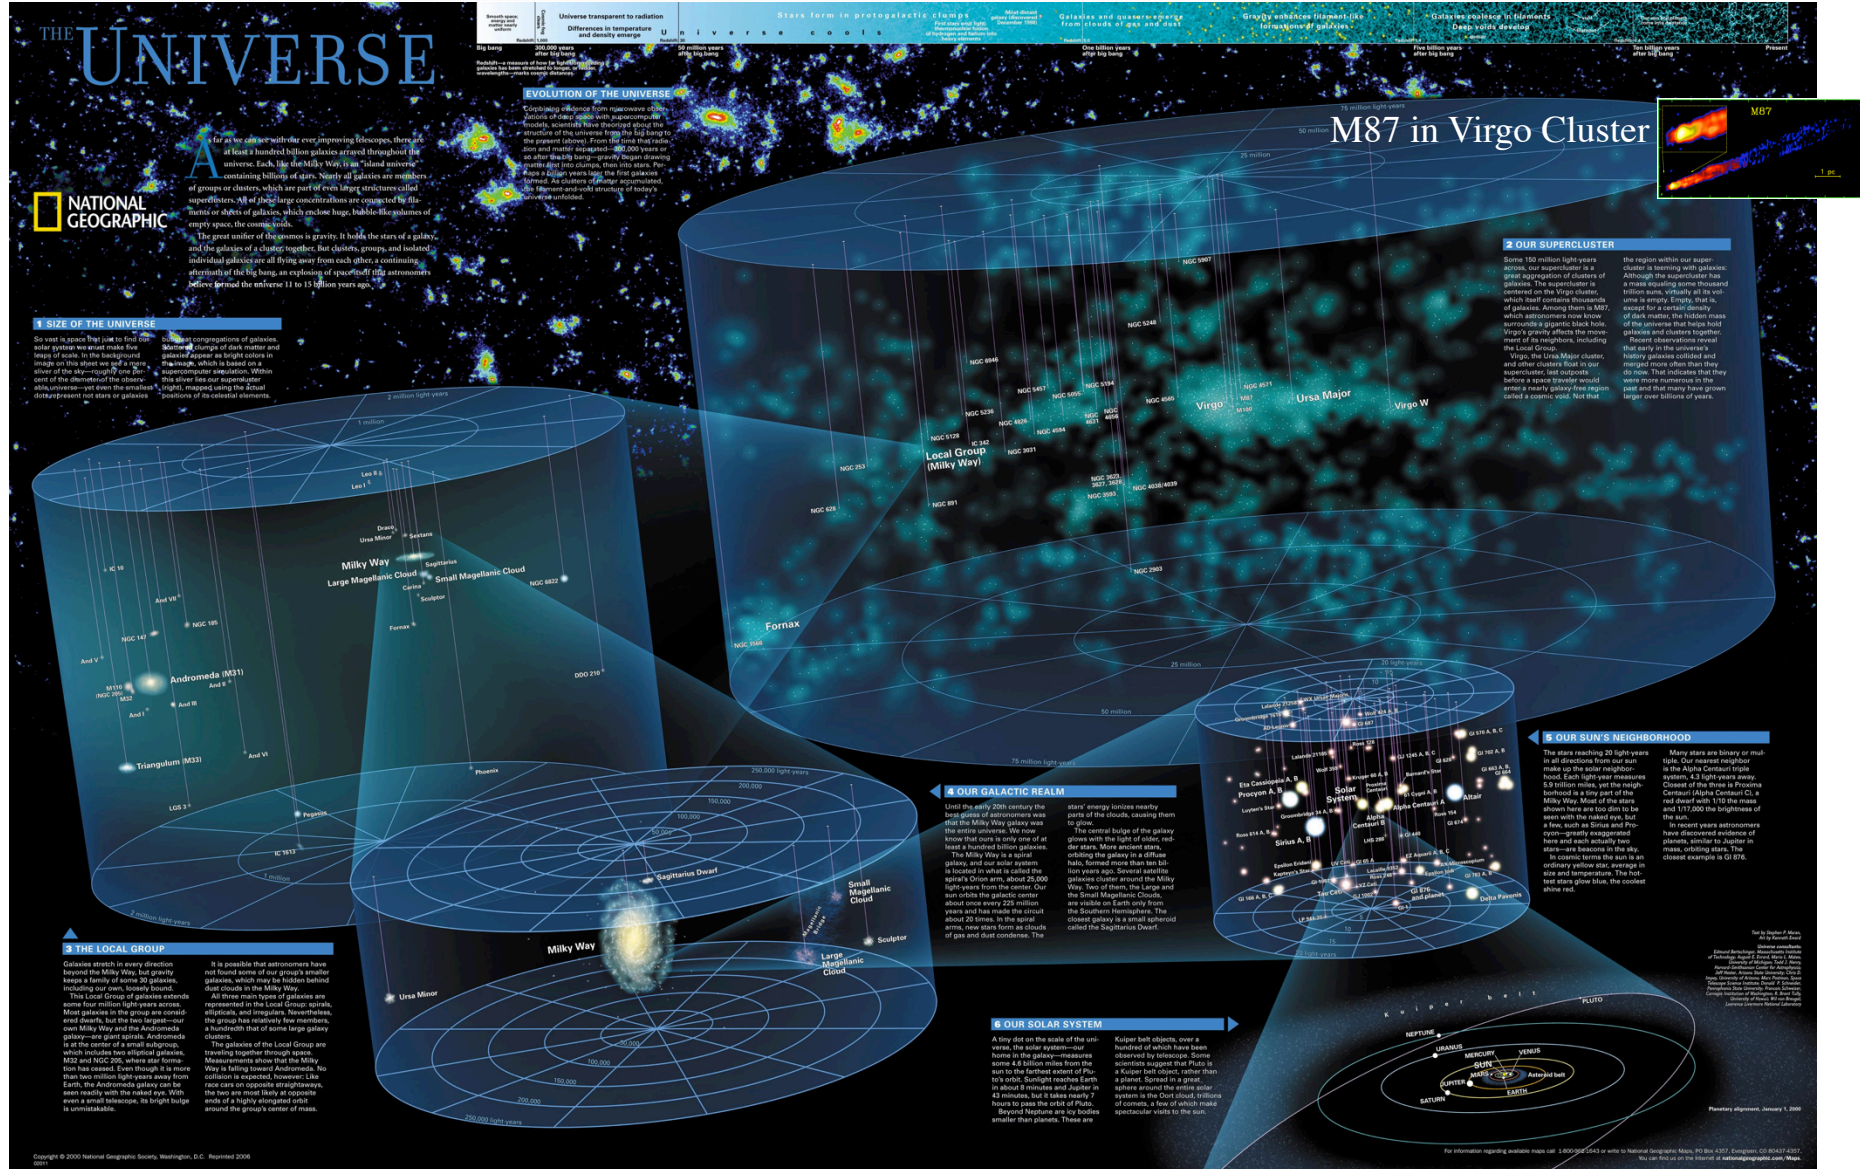

~100 Million light years

Credit: Andrew Z. Colvin

[http://commons.wikimedia.org/wiki/File%3AEarth's_Location_in_the_Universe_\(JPEG\).jpg](http://commons.wikimedia.org/wiki/File%3AEarth's_Location_in_the_Universe_(JPEG).jpg)

Quasars ~ Giga-parsec; Virgo cluster distance (50 Mpcs)

I. A.3 Inertial Frames

- Why an Inertial Frame?
Make the calculations easy! Avoid Coriolis forces etc.

No rotation

No acceleration

Univ. Illinois WW2010 Project
[http://ww2010.atmos.uiuc.edu/\(Gh\)/guides/mtr/fw/crls.rxml](http://ww2010.atmos.uiuc.edu/(Gh)/guides/mtr/fw/crls.rxml)

- Quasi-inertial
In real systems we have some unmodeled accelerations
At present, VLBI doesn't yet model acceleration toward the Galactic center, but this is being studied
e.g. Titov et al <http://arxiv.org/pdf/1301.0364v1.pdf>

- VLBI uses quasi-inertial frame with origin at the Solar System Barycenter (center of mass)

How Does VLBI Work? It's Simple ;-)

Cartoon credit: Rube Goldberg

Figure: www.vedicsciences.net/intelligent/rube-goldberg.jpg

How Does VLBI Work?

*Combine signals
from a
Phased Array*

Antennas are Mechanical Arrays

Single Large Dish
is an “array” of
panels aligned
mechanically.
Note side lobes.

beam

Imagine removing
inner panels, then
beam pattern changes,
sidelobes rise, but
center lobe still has
high resolution
 $\sim \text{wavelength} / D$

Mechanical → electrical alignment → VLBI

Two segments of antenna

“Fringes”

Two separate antennas with Electrical Connection

Same fringes as b).

Unconnected Antennas = VLBI
Time tag data and combine signals later at correlator

Same fringes as b).

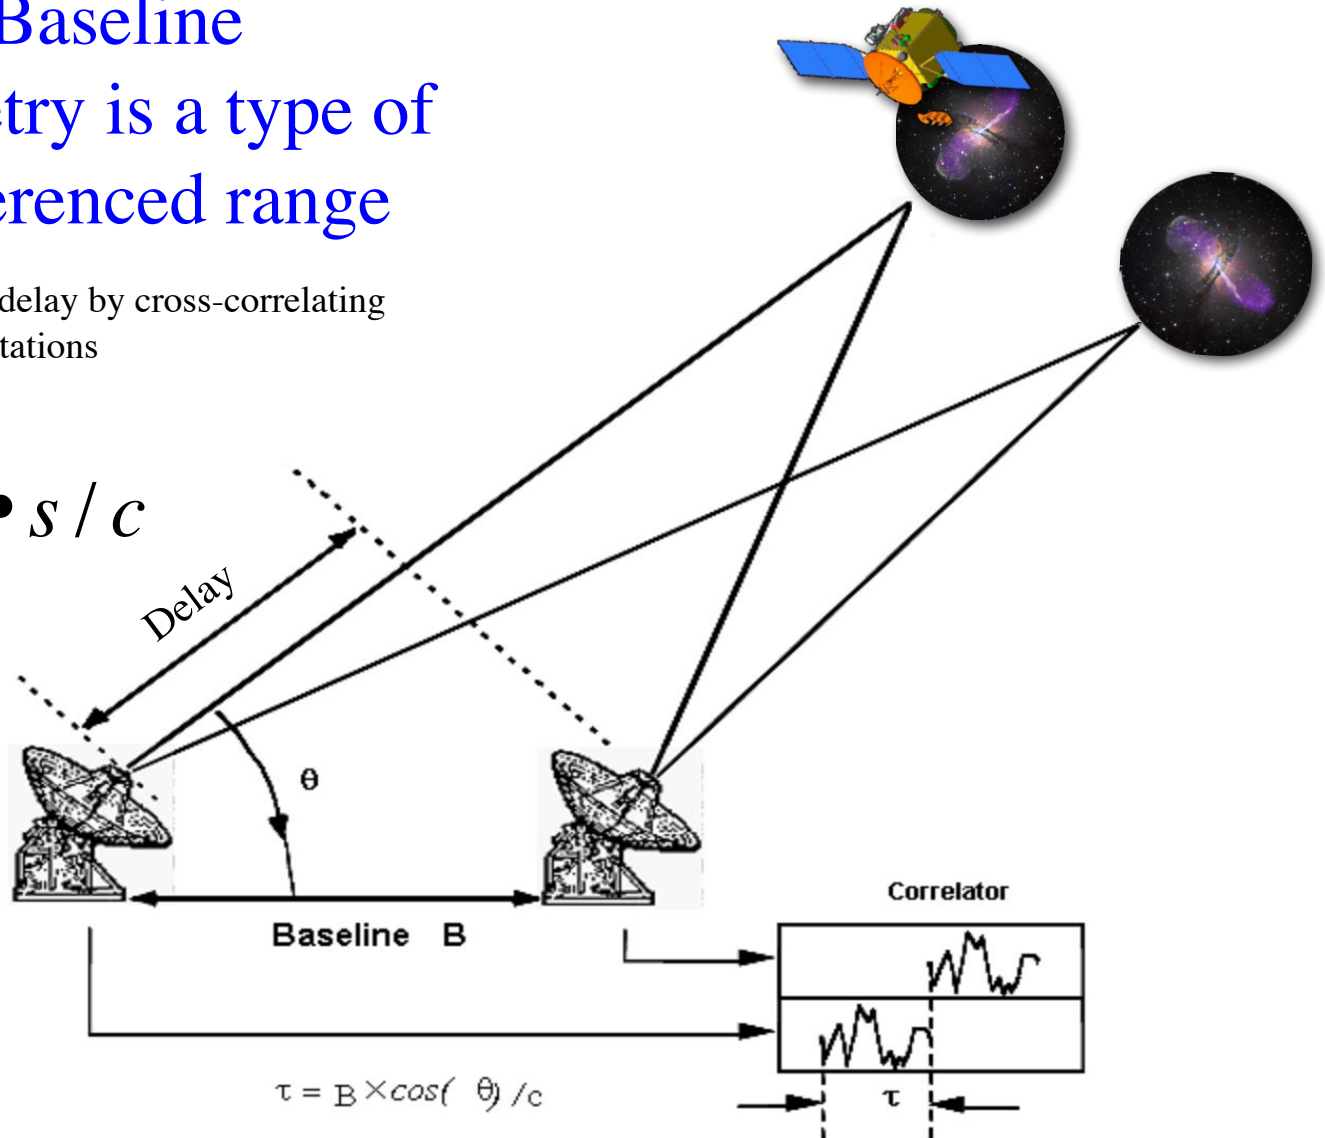

VLBI Delay: $\tau = B \cdot s / c$

Very Long Baseline Interferometry is a type of station differenced range

- Measures geometric delay by cross-correlating signal from two (2) stations

$$\tau = B \cdot s / c$$

Outline

I. Concepts and Background:

A. What is a Reference frame? Concepts, uses, desired properties

B. Networks: The instruments used to build the frame

ad hoc, VLBA, EVN, Global, NASA-ESA DSN, ESA, LBA, AuScope, etc.

C. Brief history of Astrometry: The 'fixed' stars aren't so fixed.

1. Precession, proper motion, nutation, parallax

2. Invention of radio astronomy. VLBI's pursuit of (sub)milli-arcsecond accuracy.

II. Celestial Frames built using VLBI

A. Surveys: Single dish, connected array: JVAS, AT20G, and VLBI: VCS, LCS

B. ICRF-1, ICRF-2: The IAU moves to from optical (stars) to radio (quasars)

C. Higher frequency radio frames: K&Q (24 & 43GHz), X/Ka (32 GHz)

III. The Path to the Future:

A. Error Budgets: a tool for allocating resources for improvement

B. Case study: Path to Improved X/Ka (8.4/32 GHz) Frame

C. ICRF-3: the next standard radio frame

D. Gaia: an optical frame with high accuracy

I.B. Observing Networks

Ka-band combined NASA/ESA Deep Space Net

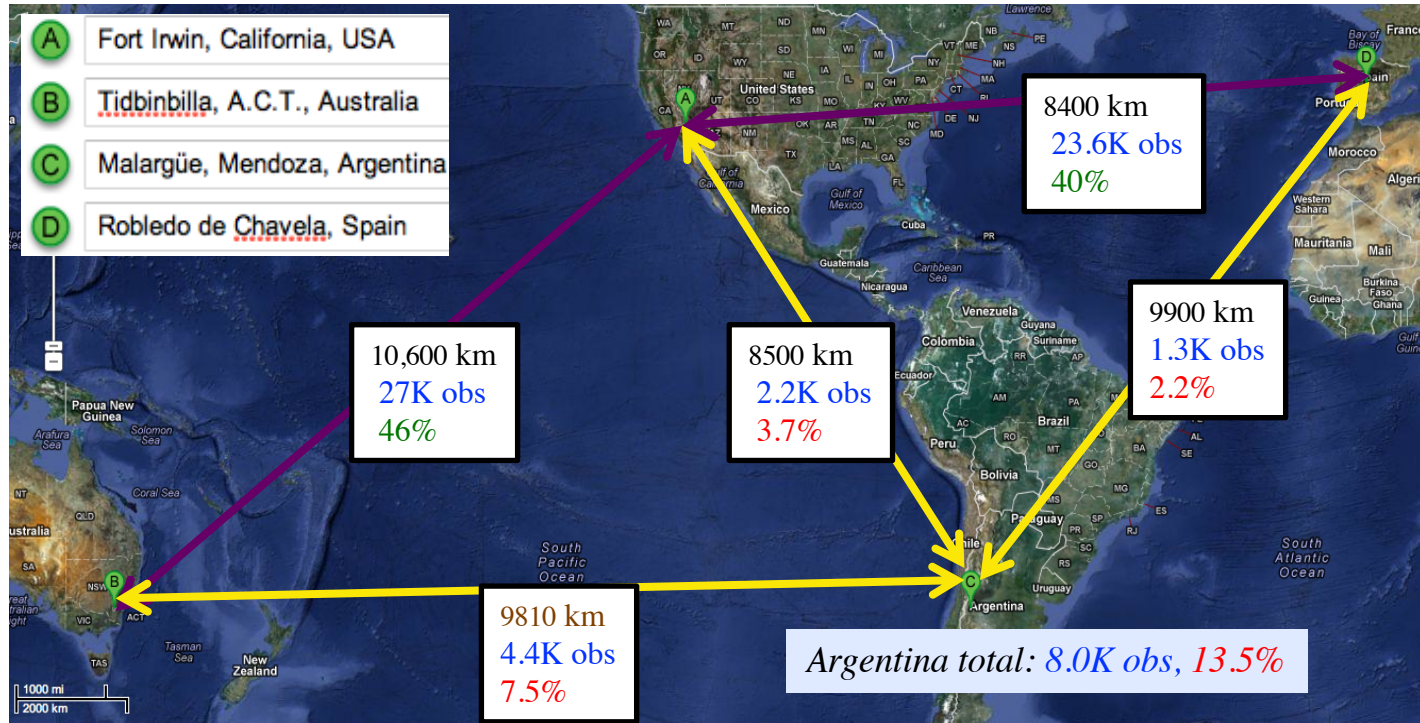

ESA Argentina to NASA-California under-observed by order of magnitude!

Baseline percentages

- Argentina is part of 3/5 baselines or 60% but only 13% of obs
- Aust- Argentina 7.5%
- Spain-Argentina 2.2%
- Calif- Argentina 3.7%

This baseline is under-observed by a factor of ~ 12.

More time on ESA's Argentina station would have a huge, immediate impact!!

Maps credit: Google maps

ESA's Argentina 35-meter antenna adds 3 baselines to DSN's 2 baselines

- Full sky coverage by accessing south polar cap
- near perpendicular mid-latitude baselines: CA to Aust./Argentina

I.C. History of Astrometry

130 B.C.	Hipparchus	Precession	50 asec/yr
<i>Telescope era:</i>			
1718 A.D.	Halley	proper motions	1 asec/yr
1729	Bradley	annual aberration	20 asec
1730	Bradley	18.6yr nutation	9 asec
1838	Bessell	parallax	~ asec
1930s	Jansky, Reber	Radio astronomy	
1960s	several groups	Very Long Baseline Interferometry (VLBI) invented	
1970s	“	VLBI	sub-asec
1980s	“	“	few 0.001 asec
1990s	“	“	< 0.001 asec
2000s	“	“	~0.0001 asec
2010s	Gaia	Optical astrometry	70 μ as for Vmag=18 quasar
2010s	ICRF-3, ESA-DSN XKa		20-70 μ as? 0.3 Jy quasar

How Does VLBI Work?

The Concept:

Point Source at Infinity

Point Source at Infinity as Reference Beacon

How does VLBI work?

- Point source at infinity as a direction reference

Extragalactic “nebulae” idea from

Laplace (1749-1827) and

Wm. Herschel (1738-1822): *in 1785*

realized that “nebulae” likely very distant

‘On the Construction of the Heavens,’ Ph.Trans.Roy.Soc., 1785, p. 213 ff.

- Advantage: **sources don't move**

BUT at a distance of a *billion* light years . . .

- The price to be paid is

Very weak sources

1 Jy = 1.0E-26 watt/m2/Hz**

need lots of square meters => 34 - 70m Antenna

lots of Hz bandwidth => 0.1 to 4 Gbps

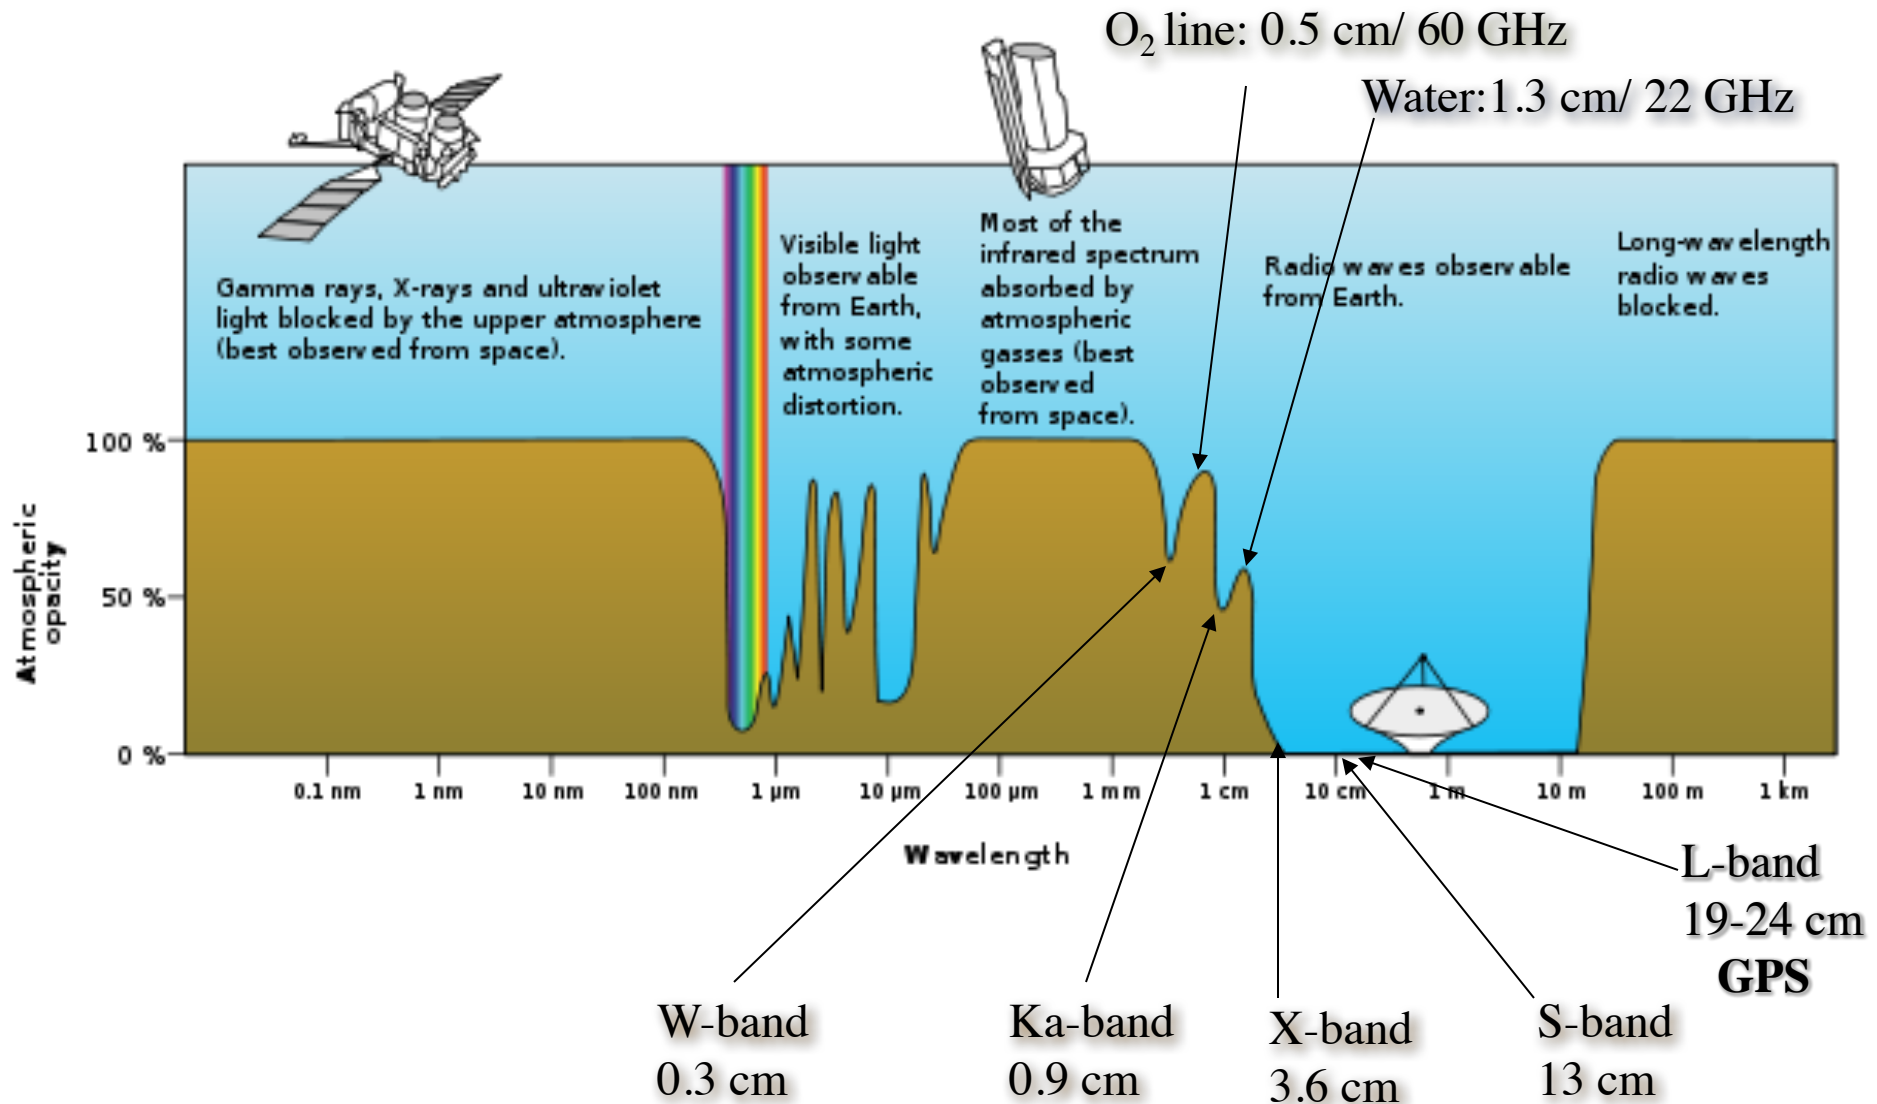

low system temperature => Tsys = 20 - 40 Kelvin

Credit: chandra.harvard.edu/photo/2008/cena/cena_multi.jpg

Why observe in Radio? The 'Window'

Credit: NASA; http://en.wikipedia.org/wiki/Radio_window

Why observe in Radio? Resolution

- Resolution of diffraction-limited telescope:
Wavelength / Diameter
example: Hubble Space Telescope
Wavelength 0.1 to 2.5 microns
Diameter 2.4 meters
Resolution = 10 to 250 mas
- Resolution for an interferometer
Wavelength / Baseline
Wavelengths for Celestial Frames 0.9 to 3.6 cm
Baselines up to 10,000 km
Resolution = 1 to 4 nanoradians = 0.2 to 0.8 mas
- Radio has 50 times better resolution than Hubble.

Why observe in Radio? Resolution

THE QUEST FOR RESOLUTION

Resolution = Observing wavelength / Telescope diameter

Angular Resolution	Optical (5000Å)		Radio (4cm)	
	Diameter	Instrument	Diameter	Instrument
1'	2mm	Eye	140m	GBT+
1"	10cm	Amateur Telescope	8km	VLA-B
0."05	2m	HST	160km	MERLIN
0."001	100m	Interferometer	8200km	VLBI

Atmosphere gives 1" limit without corrections which are easiest in radio

Credit: R. Craig Walker, NRAO, AAAS, 2001, http://www.aoc.nrao.edu/~cwalker/talks/aaas_2001/std002.htm

X/Ka sources (blue) which are surrounded by Red squares are also in the Fermi 2FGL gamma-ray point source catalog. Over 1/3 of X/Ka sources (~175) have gamma-ray detections.

Active Galactic Nuclei (*Marscher*)

$R \sim 0.1 - 1 \mu\text{as}$

1mas

Features of AGN: *Note the Logarithmic length scale.*

“Shock waves are frequency stratified, with highest synchrotron frequencies emitted only close to the shock front where electrons are energized. The part of the jet interior to the mm-wave core is opaque at cm wavelengths. At this point, it is not clear whether substantial emission occurs between the base of the jet and the mm-wave core.”

Celestial Reference Frame: Long term stability

GPS is not sufficient for a long term inertial frame

Orientation: Relative to what?

One must define stable (ppb) reference directions

- GPS orbits are well modelled (ppb) over ~day time periods.

But . . .

- **GPS constellation node drifts over weeks. . .**

1.e18
increase
in range

**Solution: Change sources from range of
GPS' s nano-Light year to
VLBI's Giga-Light Years
~eighteen (18) orders of magnitude!**

Celestial Pole & Alignment of Axes

From [German Wikipedia](#),
by [User Herbye](#).

- VLBI determines angles *between* sources
- Absolute positions only weakly determined at 10-100 mas level by tidal effects (RA, dec of Sun & Moon) and atmospheric effects (elevation)
- Orientation of axes is defined at sub-mas level by convention
- Enforced by No-Net-Rotation constraint:

$$\sum_{i=1}^N s \times \Delta s = 0$$

where s direction is source unit vector
cf. [Jacobs et al, IVS, 2010](#).

<http://ivscc.gsfc.nasa.gov/publications/gm2010/jacobs2.pdf>

Outline

I. Concepts and Background:

- A. What is a Reference frame? Concepts, uses, desired properties
- B. Networks: The instruments used to build the frame
ad hoc, VLBA, EVN, Global, NASA-ESA DSN, LBA, AuScope, etc.
- C. Brief history of Astrometry: The 'fixed' stars aren't so fixed.
 - 1. Precession, proper motion, nutation, parallax
 - 2. Invention of radio astronomy. VLBI's pursuit of (sub)milli-arcsecond accuracy.

II. Celestial Frames built using VLBI

- A. Surveys: Single dish, connected array: JVAS, AT20G, and VLBI: VCS, LCS**
- B. ICRF-1, ICRF-2: The IAU moves to from optical (stars) to radio (quasars)**
- C. Higher frequency radio frames: K&Q (24 & 43GHz), X/Ka (32 GHz)**

III. The Path to the Future:

- A. Error Budgets: a tool for allocating resources for improvement
- B. Case study: Path to Improved X/Ka (8.4/32 GHz) Frame
- C. ICRF-3: the next standard radio frame
- D. Gaia: an optical frame with high accuracy

II.B. The Transition from Optical to Radio

- Optical to Radio transition era documented in
Hans Walter & Ojars Sovers, *Astrometry of Fundamental Catalogues: The Evolution from Optical to Radio Reference Frames*, 2000
<http://adsabs.harvard.edu/abs/2000afce.conf.....W>
- Fundamental Katalog FK5 (Fricke, 1988)
<http://adsabs.harvard.edu/abs/1988VeARI..32....1F>
1535 stars limited by proper motions of stars
~150 mas regional differences from ICRF1 <http://adsabs.harvard.edu/abs/1997IAUJD...7E..24M>
- IAU called for a move to Active Galactic Nuclei (AGN)
obtain very distant sources (redshift ~ 1 , ~ 5 billion light years)
No parallax, no proper motion
- IAU formed in 1990s a working group on
International Celestial Reference Frame (ICRF)
- ICRF-1 adopted by the IAU as on 1998 Jan 01.
Ma et al, *AJ*, 116, 516, 1998 <http://adsabs.harvard.edu/abs/1998AJ....116..516M>

II.A. Surveys: How are sources found? Positions?

1. **Single dish surveys:** A single radio telescope sweeps the sky to search for point-like sources. Example: Parkes-MIT-NRAO 4.8 GHz (Griffith & Wright, 1993) ~10 arcsec positions.

<http://www.parkes.atnf.csiro.au/observing/databases/pmn/pmnpubs.html> 1993AJ....105.1666G

2. **Connected element array surveys:**
 - next step is interferometric connected arrays such as the Very Large Array or ATCA
 - **Positions improved to 10s of milli-arcsec**

- **North:** Jodrell Bank VLA Survey (JVAS) (Patnaik et al, MNRAS, 1992)

<http://adsabs.harvard.edu/abs/1992MNRAS.254..655P>

<http://www.vla.nrao.edu/>

- **South:** ATCA 20-GHz (AT20G), 5890 sources, Southern hemisphere (Murphy et al, MRAS, 2010)

<http://www.atnf.csiro.au/research/AT20G> <http://adsabs.harvard.edu/abs/2010MNRAS.402.2403M>

3. **Final Survey stage:** VLBI gets ~milli-arcsec positions e.g

- **North:** VLBA Calibrator Survey (Beasley et al, ApJS, 2002)

<http://adsabs.harvard.edu/abs/2002ApJS..141...13B>

- **South:** LBA Calibrator Survey, (Petrov et al, MNRAS, 2011)

<http://arxiv.org/abs/1012.2607> <http://adsabs.harvard.edu/abs/2011MNRAS.414.2528P>

K(1.2cm) Declinations vs. S/X ICRF2 (current IAU standard)

Credit: K(1.2cm): Lanyi et al, AJ, 139,5, 2010

S/X ICRF2: Ma et al, editors: Fey, Gordon & Jacobs, IERS, Germany, 2009

K-band (24 GHz) CRF: 826 sources

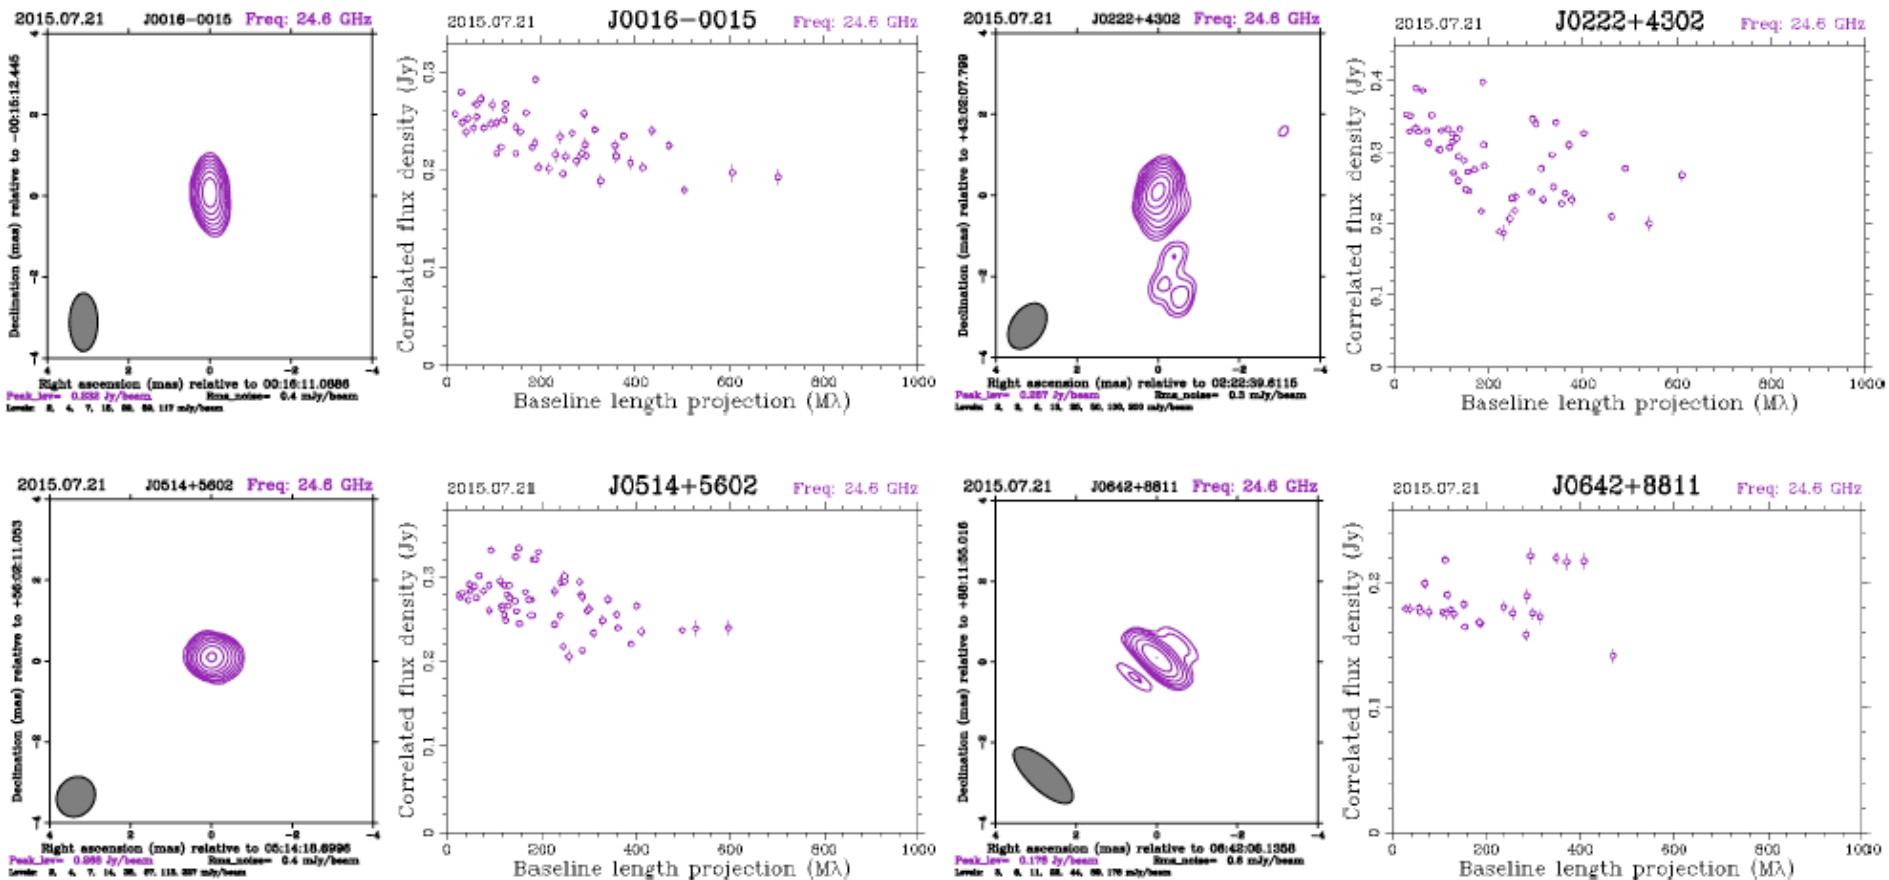

VLBA 35 sessions @2Gbps to densify the north (*de Witt et al, EVGA, 2017*)

Hart-Hobart (Tianma): 15 sessions. Archive (*Lanyi et al, 2010, Petrov et al, 2006*).

Imaging: VLBA at 24 GHz (1.2cm) (de Witt et al, 2016)

K-band (24 GHz) imaging shows VLBI sources are compact on millarcsec scales.
 Data for 5000+ sources acquired. Processing limited by available analyst resources.
 Imaging will be prioritized as comparison outliers pinpoint sources of interest

The authors gratefully acknowledge use of the Very Long Baseline Array under the US Naval Observatory's time allocation. This work supports USNO's ongoing research into the celestial reference frame and geodesy.

Overview

I. Concepts and Background:

A. What is a Reference frame? Concepts, uses, desired properties

B. Networks: The instruments used to build the frame

ad hoc, VLBA, EVN, Global, NASA-ESA DSN, LBA, AuScope, etc.

C. Brief history of Astrometry: The 'fixed' stars aren't so fixed.

1. Precession, proper motion, nutation, parallax

2. Invention of radio astronomy. VLBI's pursuit of (sub)milli-arcsecond accuracy.

II. Celestial Frames built using VLBI

A. Surveys: Single dish, connected array: JVAS, AT20G, and VLBI: VCS, LCS

B. ICRF-1, ICRF-2: The IAU moves to from optical (stars) to radio (quasars)

C. Higher frequency radio frames: K&Q (24 & 43GHz), X/Ka (32 GHz)

III. The Path to the Future:

A. Error Budgets: a tool for allocating resources for improvement

B. Case study: Path to Improved X/Ka (8.4/32 GHz) Frame

C. ICRF-3: the next standard radio frame

D. Gaia: an optical frame with high accuracy

Error Budget for Reference Frame VLBI

The Tall Tent Poles

Δ VLBI Error Budget

Overview

I. Concepts and Background:

Status 2012: X/Ka RA results 482 Sources

Cal. to Madrid, Cal. to Australia. **Weakens south of Dec = -15deg**

Status 2012: X/Ka Dec results 482 Sources

Cal. to Madrid, Cal. to Australia. **Weakens southward.** **No ΔDec tilt**

Focus Work on the Tall Tent Poles

Systems Analysis shows dominant Errors are

- **Limited SNR/sensitivity**
 - already increased bit rates in 2009: 112 to 448 Mbps.
 - 2048 Mbps fringes May 2013. 1-2 Gbps operational in 2014
- **Instrumentation:** already building better hardware
 - BWG phase calibrators, Digital baseband conversion & filters
- **Troposphere:** better calibrations being explored
- **Weak geometry in Southern hemisphere**
 - Limits accuracy to about 1 nrad ($200 \mu\text{as}$) level
 - Need observations below Declination of -45 Deg!
 - DSN at X/Ka had only Canberra, Australia (DSS 34)
 - Needed 2nd site in the Southern hemisphere especially for upcoming southern ecliptic missions: Maven (2014), Exo-Mars (2016), InSight (2018).

Attacking the Error budget

- **SNR can be improved +6 to 9 dB!**
- Instrumentation:
 - Phase calibration with test signals
 - Digital Baseband Conversion & Filtering
- Troposphere calcs: WVR
- Southern Geometry

Results have been limited by SNR

Solution:

1) More bits:

112 Mbps 2005

448 Mbps 2010

2014 Mbps 2013

4.3 increase sensitivity
+6.3 dB SNR

2) Ka pointing

Now with improved
Pointing calibrations
~3 dB more SNR

Total vs. early passes
+9 dB SNR increase!

Results have been SNR limited for SNR < 30 (15 dB)

Phased implementation, testing

- **Data rate: 43 passes @ 112 Mbps (X/Ka 56/ 56 Mbps)**
 - 3 passes @ 224 Mbps (X/Ka 80/144) ~ 3X**
 - 30 passes @ 448 Mbps (X/Ka 160/288) ~ 5X**
 - current @ 2048 Mbps (X/Ka 640/1408) ~25X**

Total Ka improvement 56 to 1408 Mbps => 5-10 psec del. precision

Reduces SNR below troposphere with increased Ka sensitivity!
Thus SNR will longer be the tallest tent pole.

Credit: NASA: C. Jacobs, D. Bagri, E. Clark, C. Garcia-Miro, C. Goodhart, S. Horiuchi, S. Lowe, E. Moll, L. Skjerve, L White

Later, we got
independent
confirmation
from ACME
automated
bore sight
system of
18 mdeg
errors

Attacking the Error budget

- SNR can be improved +8 dB!
- **Instrumentation:**
 - Phase calibration with test signals
 - Digital Baseband Conversion & Filtering
- Troposphere calcs: WVR
- Southern Geometry

Results limited by instrumental delays

- **Problem:** diurnal thermal effect on cables, time lag $3/4$ hour
- **Solution:** Ka-band Phase calibrator, uses test tones to measure delay
- **Unit is now operational in California**
Spain and Australia expected to have units in 1-2 years

BWG Phase Calibrator

- Concept: Tunnel diode
Alan Rogers et al (Haystack)
- JPL prototype BWG phase cal:
Hammel, Tucker, & Calhoun,
JPL Progress Report, 2003
- Production units: Blake Tucker

http://tmo.jpl.nasa.gov/progress_report/42-154/154H.pdf

Summary of Instrumental Improvements

<u>Instrument</u>	<u>MkIV</u>	<u>DBE/Mk5-C</u>	<u>Comment</u>
Filters	Analog 7-pole Butterworth	Digital FIR phase linear	removes phase ripple in channel
Spanned bandwidth	360 MHz	500 MHz	Mk4 limit 1.4X improvement
Data rate @ start	112 Mbps		DSN SNR limited
@ max.	896 Mbps		trop/inst. limited
@ start		2048 Mbps	trop/inst. limited
@ max.		4096 Mbps	6X sensitivity
Phase Cal: HEF/70m	Yes	Yes	
BWG	No	Yes	removes 100s of psec

Attacking the Error budget

- SNR can be improved +8 dB!
- Instrumentation:
 - Phase calibration with test signals
 - Digital Baseband Conversion & Filtering
- **Troposphere cals: WVR**
- Southern Geometry

Troposphere Solution 1: Better Estimation

- Modified Least Squares to account for observation correlations -- both temporal and *spatial*
- Use Kolmogorov frozen flow model of Treuhaft & Lanyi (Radio Sci. 1987)
- Model increases information available to the estimation process
 - 1) Reduces parameter biases
 - 2) Reduces parameter sigmas
- Validation: Currently improves agreement X/Ka vs. S/X catalogs by about 10% in Declinations.

Expect ~30% after SNR & phase cal errors peeled away to reveal troposphere errors.

Romero-Wolf & Jacobs, IVS, 2012 http://www.oan.es/gm2012/pdf/oral_id_119.pdf

Calibrating Troposphere Turbulence

- JPL Advanced Water Vapor Radiometer

Malargüe: The Next X/Ka VLBI Station

X/Ka: ESA Deep Space Antenna DSA 03

- **Malargüe, Argentina**
- Fall-2012 NASA/ESA collaboration
- 35-m, X/Ka-band, 9,500 km baseline
Argentina-Australia covers south polar cap
Full sky coverage for X/Ka!!
- Argentina-California & Australia-California orthogonal baselines for mid-latitudes
- High (1.5km), dry desert site: good for Ka-band
- HA-Dec coverage: Tidbinbilla to Malargüe:

Malargüe, Argentina 35-meter as of 26 Sept .2012

ESA Deep Space Antenna
X/Ka-band capable

X/Ka stations for Celestial Frame

ESA's Argentina 35-meter antenna **adds 3 baselines** to DSN's 2 baselines

- Full sky coverage by accessing south polar cap
- near perpendicular mid-latitude baselines: CA to Aust./Argentina

Maps credit: Google maps

NASA-only 32GHz Dec results: 482 sources

DSN only data before Oct 2012: Goldstone, CA to Madrid, Australia.
 Weak in the mid-south (Dec 0 to -45), no south Polar Cap (-45 to -90)

DSN: Goldstone, CA to Madrid & Canberra

+ ESA baselines: Malargüe to Canberra, Goldstone, Madrid

Outline

I. Concepts and Background:

A. What is a Reference frame? Concepts, uses, desired properties

B. Networks: The instruments used to build the frame

ad hoc, VLBA, EVN, Global, NASA-ESA DSN, LBA, AuScope, etc.

C. Brief history of Astrometry: The 'fixed' stars aren't so fixed.

1. Precession, proper motion, nutation, parallax

2. Invention of radio astronomy. VLBI's pursuit of (sub)milli-arcsecond accuracy.

II. Celestial Frames built using VLBI

A. Surveys: Single dish, connected array: JVAS, AT20G, and VLBI: VCS, LCS

B. ICRF-1, ICRF-2: The IAU moves from optical (stars) to radio (quasars)

C. Higher frequency radio frames: K&Q (24 & 43GHz), XKa (32 GHz)

III. The Path to the Future:

A. Error Budgets: a tool for allocating resources for improvement

B. Next-generation geodetic VLBI: Ultra-wide 2-14 GHz

B. Case study: Path to Improved X/Ka (8.4/32 GHz) Frame

C. ICRF-3: the next standard radio frame

D. Gaia: the return of optical

III.C. ICRF-3

3rd generation International Celestial Reference Frame

Assessment of needs for ICRF-3

1. VLBA Cal Survey is most (2/3) of ICRF-2
but positions are 5X worse than rest of ICRF-2
2. ICRF-2 is weak in the south
3. High frequency frames
Fewer sources, weak in the south

Goals:

1. Complete ICRF-3 by 2018
in time for comparisons with Gaia optical frame
2. Competitive accuracy with Gaia $\sim 70 \mu\text{as}$ (1-sigma RA, Dec)
3. Uniform precision for all sources. Implies improving VCS positions.
4. High frequency frames (K, XKa, Q?)
Improve number, accuracy, and southern coverage
5. Maximize high quality optical-radio tie sources

ICRF-2 reference: Ma et al, IERS, 2009. <http://adsabs.harvard.edu/abs/2009ITN....35....1M>

Figure Credit: Heinkelmann, EVGA, 2013

III.C. ICRF-3 Needs

- Uneven precision of current ICRF-2 VCS's 2200 sources (2/3 of the ICRF-2)
- VCS precision is typically $1000 \mu\text{as}$
5 times worse than the rest of ICRF2!

Good news:

- VLBA Cal Survey-II
VLBA approved 8 x 24-hour sessions to re-observe VCS sources.

PI: David Gordon, GSFC

8 passes completed

paper submitted to AJ Feb 2016

ICRF2: VCS vs. Non	Item	VCS	non-VCS	factor	.
	N_src	2197	1217	VCS	1.8X better
	median sessions	1	13	VCS	13X worse
	median observations	45	249	VCS	5.5X worse
	median time span	0	13 years	VCS	arbitrarily worse
	median RA sigma	621	130 μas	VCS	4.8X worse
	median Dec sigma	1136	194 μas	VCS	5.9X worse

VLBA Calibrator Survey improvement

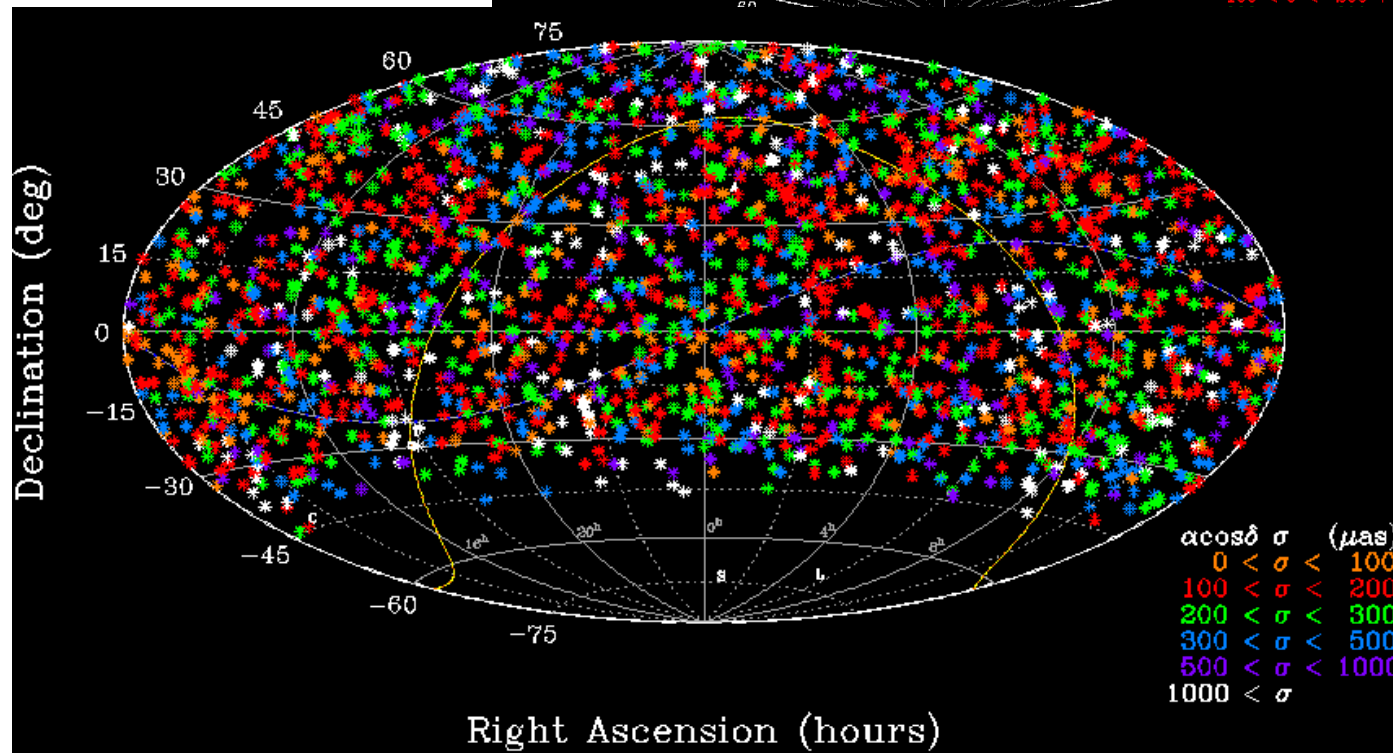

VCS-I: ~ 1 mas precision
for 2200 sources

credit: Beasley et al, AJ, 2002

VCS-II:
RA 0.23 mas
Dec 0.39 mas

Improvement
 ~ 5 times

III.C. ICRF-3 Needs

Southern Hemisphere:

VLBI generally & ICRF-2 specifically lacks southern observations (Dec < -35 deg)

AuScope, Hobart, HartRAO exploring additional S/X observations

III.C. ICRF-3 Needs

K-band frame (24 GHz) lacking in the south for Dec < -30 deg (limit of VLBA work)

K-band: HartRAO to Hobart, Tasmania

New K-band CRF collaboration: cf. Bertarini et al & de Witt et al, Journees 2013

K-band (24 GHz) CRF: 826 sources

VLBA 35 sessions @2Gbps to densify the north (*de Witt et al, EVGA, 2017*)

Hart-Hobart (Tianma): 15 sessions. Archive (*Lanyi et al, 2010, Petrov et al, 2006*).

- **Deficiency: Weaker in the south.** S. cap 134 sources ($dec < -45$); 27 ICRF2 Defining
- **Full sky coverage (681 sources):** NASA baselines CA to Madrid & Australia + recently added ESA Malargüe, Argentina to Tidbinbilla, Australia, PI: Jacobs

9mm vs. 3.6cm? Core shift & structure

Credit: A. Marscher, Proc. Sci., Italy, 2006.
Overlay image: Krichbaum, et al, IRAM, 1999.
Montage: Wehrle et al, ASTRO-2010, no. 310.

Positions differences from 'core shift'

- wavelength dependent shift in radio centroid.
- *3.6cm to 9mm core shift:*
 - **100 μ as in phase delay centroid?**
 - **$\ll 100 \mu$ as in group delay centroid?** (Porcas, AA, 505, 1, 2009)
- shorter wavelength closer to Black hole and Optical: **9mm X/Ka better**
- **Event Horizon Telescope (230 GHz) probing ~ 10 Schwarzschild radii (Doelman et al)**

Hints that results improve by going to higher radio frequency
 However, the above results do not use exact same objects

Gaia Optical vs. X/Ka frame tie

- Gaia Data Release #1 2016 September:
median sigmas $\sim 500 \mu\text{as}$ per component
Gaia Data release #2 2018 April
- VLBI XKa radio sigmas $\sim 100 \mu\text{as}$ per component and improving
- 3-D rotational sigmas $\sim 20 \mu\text{as}$
- Potential for rotation sigmas $\sim 5 \mu\text{as}$ per frame tie component
after which the limitation is the number of XKa sources.
- Expect that accuracy will be limited by systematic errors—
In particular zonal errors vs. Dec in the VLBI frames

Conclusions

I. Concepts and Background:

- A. Desire nonrotating, non-accelerating frame. Use a quasi-inertial with some accelerations
- B. Networks: The instruments used to build the frame
ad hoc, VLBA, EVN, Global, NASA-ESA DSN, ESA, LBA, AuScope, etc.
- C. Brief history of Astrometry: The ‘fixed’ stars aren’t so fixed.
 - 1. Precession, proper motion, nutation, parallax
 - 2. Invention of radio astronomy. VLBI’s pursuit of sub-milli-arcsecond accuracy.

II. Celestial Frames built using VLBI

- A. Surveys: Single dish,
connected arrays: Jodrell-VLA (JVAS, north), ATCA 20 GHz (AT20G, south),
VLBI ~mas: VLBA Cal Survey (north), LBA Cal Survey (south)
- B. ICRF-1 (1998): The IAU moves to from optical (stars) to 212 Defining quasars.
ICRF-2 (2009) : 295 defining sources, 3414 total, 40 μ as systematic floor
- C. Higher frequency radio frames: K & Q (24 & 43GHz), X/Ka (32 GHz)
100 to 200 μ as agreement with SX

III. The Path to the Future:

- A. Error Budgets: a tool for allocating resources for improvement
- B. Case study: Improved X/Ka Frame: SNR, Instrumentation, Troposphere, *Geometry*
- C. ICRF-3 goals: 2018, improve south, improve VCS, improve K & X/Ka
- D. Gaia: 2024 the return of optical, 500,000 quasars, ~billion total sources

Thank You for your Attention

*Estrellas, que rodean, señas,
Ojos, mis ojos captan la luz,
suave palpitar de mi corazón,
llevado en alto por la brisa
vuelo de mi alma,
libre, nacida de nuevo
bajo un cielo maravilloso.*

*Y yo, mínimo ser,
ebrio del gran vacío constelado,
a semejanza, a imagen del misterio,
me sentí parte pura del abismo,
rodé con las estrellas,
mi corazón se desató en el viento.*

- Pablo Neruda

*And I, infinitesimal being,
inebriated on the great starry void,
likeness, image of mystery,
I felt myself a pure part of the abyss,
I rode with the stars,
my heart broke free onto the open sky.*
